

Release Notes (plain HTML, for future maintainers).

1. Sections, in this order: Release Status; Open Bugs; Major Improvements in This Release; Test Suite Growth; Known Limitations; Known Minor Maintenance Items; Version Identification. Title block gives version, build and date.
2. Scope: the current release and its two most recent code-changing rounds since the last notes. A review-only round that changed nothing is mentioned only in Release Status. Earlier notes are not reproduced.
3. Release Status, Improvements, Test Growth: short. Status names the two rounds and each reviewer's latest release recommendation, including any hold. Improvements list user-visible changes, including any that change printed numbers. Test Growth gives counts per version and how the suite is run and passed.
4. Open Bugs: every reviewer-reported defect of severity P1–P3 unresolved at release. Each entry has an ID, severity, the reviewer's finding ID, a one-sentence symptom, and a one-line reproduction with the observed and expected result. No causes and no fixes.
5. Known Limitations (design and data-provenance limits) and Known Minor Maintenance Items (unresolved P4 items and other non-defect observations): one or two lines each, no causes, no fixes.
6. Plain HTML only: headings, paragraphs, lists, and b/i/code/sub/sup. No CSS, tables or scripts.

SampleOutputs guide (self-contained HTML, for an instructor who has the Help open).

1. Keep the current layout: header with version, build and date; a purpose note; contents; then one section per figure.
2. Each figure section has the exact command, the embedded figure, a one-sentence caption, "What it shows" (3–4 bullets), and "Headline values" (3–5 bullets). A short "Notes for evaluation" and an image-provenance paragraph close the guide.
3. Exactly one figure per Beat of the Help, in Beat order. If a Beat has several commands, show one and cover the others in its headline values. If two Beats share a command, use a different command for the second.
4. Regenerate every figure from the released build with the commands shown; never reuse older images. State the version, build and date in the provenance note.

5. Headline values come from that build's run output. No HTML tables, no printed console tables, no exercise mapping, no retelling of the tutorial.

Both: update them only after the audit and fix rounds are finished, using the final package's version and build.
